

Guidelines for the final presentation

The IC design project course ends with a *Final Presentation Day*. In this meeting each student gives a 15-20 minutes long presentation. The aim of this document is to give advices on how to make a good presentation. On one hand, the presentation should give an overview on your topic in such a way that your fellow students are able to understand what you have done and why. On the other hand, try to point out the challenges you have experienced and the solution you have achieved.

Typical context of a presentation is as follows:

1. Title page
2. Outline page - in the presentation you will guide the audience: what will follow
3. List of material (references): what books, papers, www-pages etc. you have studied/used for this work
4. - 6. Some slides about background and motivation
7. - 14. Technical details
15. Summary - what you have done and achieved, what you have learnt
16. - NN. Appendices: here you can add schematics and results to document your work - these slides will not be shown to the audience. Your instructor, for instance, may be interested on some details that you can report here. These appendix slides can be of lower quality - no need to prepare presentation-quality figures, for instance.

Figures: All figures, such as schematics and simulation results, need to be of high quality. This means, among others, sufficiently large font size, thick lines, and important message clearly depicted while all unimportant details have been removed. DO NOT copy schematics directly from a CAD tool and do not use figures directly from any result browser. Instead, all result figures should be prepared with a matlab script and all the schematics drawn with a drawing software, such as inkscape.

In the VSPACE directory /home/E3560/ Final_Presentation/figure_guide.pdf you will find detail information about how to use matlab and inkscape for producing these high-quality figures.

Presentation slides should be produced with Powerpoint.

Template is available at /home/E3560/Final_Presentation/Final_presentation_template.ppt

If you are skilled with Latex, you may use it as well, but no template available.

Convert your presentation to PDF-FILE and return it to a return box at MyCourses pages
